High normal  
and normal BP

**J Hypertens 2017, Nov**

# 2017 Meta-analyse n° 10

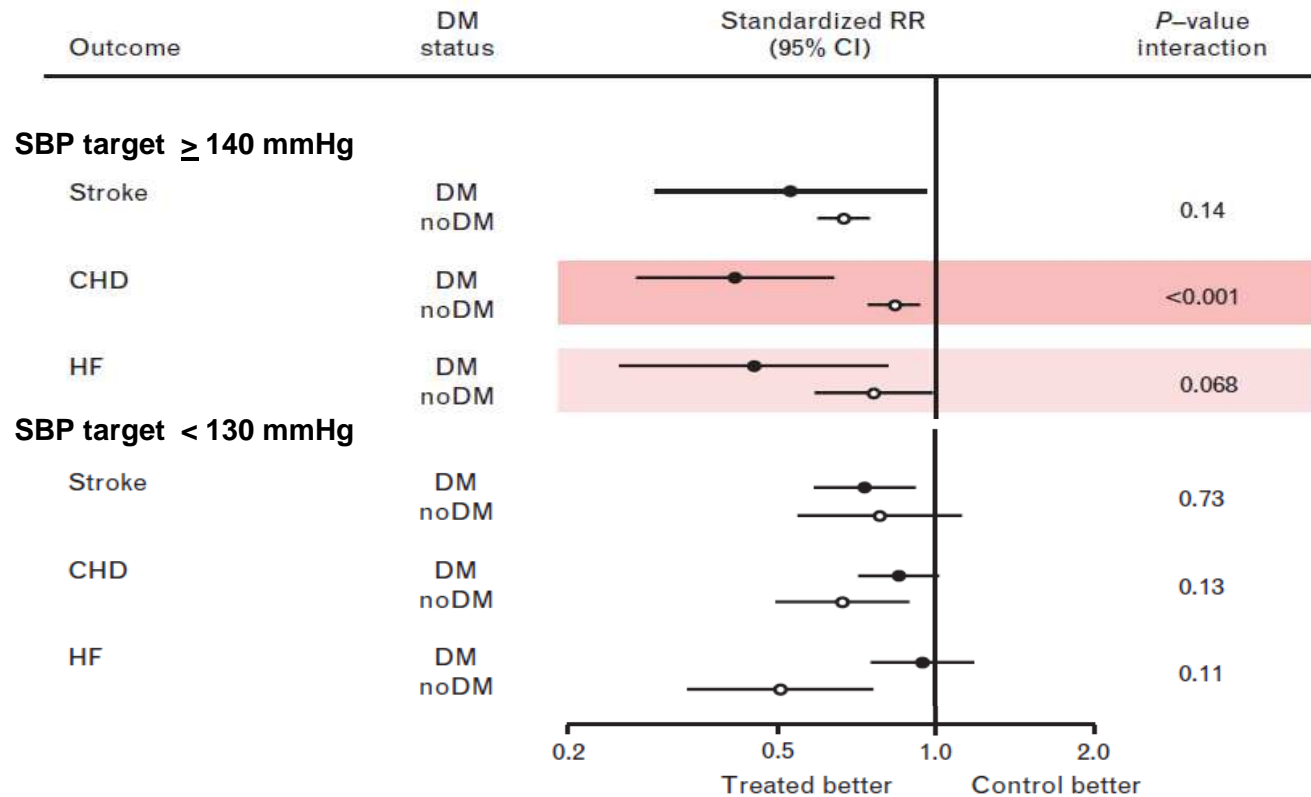

Diabetes

Effects of blood-pressure-lowering treatment on outcome incidence in hypertension: 10 – Should blood pressure management differ in hypertensive patients with and without diabetes mellitus? Overview and meta-analyses of randomized trials

Costas Thomopoulos<sup>a</sup>, Gianfranco Parati<sup>b,c</sup>, and Alberto Zanchetti<sup>d,e</sup>

41 RCTs on 61 772 DM and 191 353 without

**Conclusion:** Contrary to past recommendations, in diabetes mellitus there is little or no further benefit in lowering SBP below 130 mmHg, whereas continuing benefit is seen in no diabetes mellitus also at SBP below 130 mmHg.

# 2017 Meta-analyse n° 11

CV risk and achieved BP in non DM

Effects of blood-pressure-lowering treatment on outcome incidence in hypertension. II. Effects of total cardiovascular risk and achieved blood pressure: overview and meta-analyses of randomized trials

Costas Thomopoulos<sup>a</sup>, Gianfranco Parati<sup>b,c</sup>, and Alberto Zanchetti<sup>d,e</sup>

**Conclusion:** A high level of cardiovascular risk is not in itself a restraint to target at SBP values less than 130 mmHg, if treatment is well tolerated.

72 RCTs on 260 210 patients **without DM**

# 2017 Meta-analyse n° 12

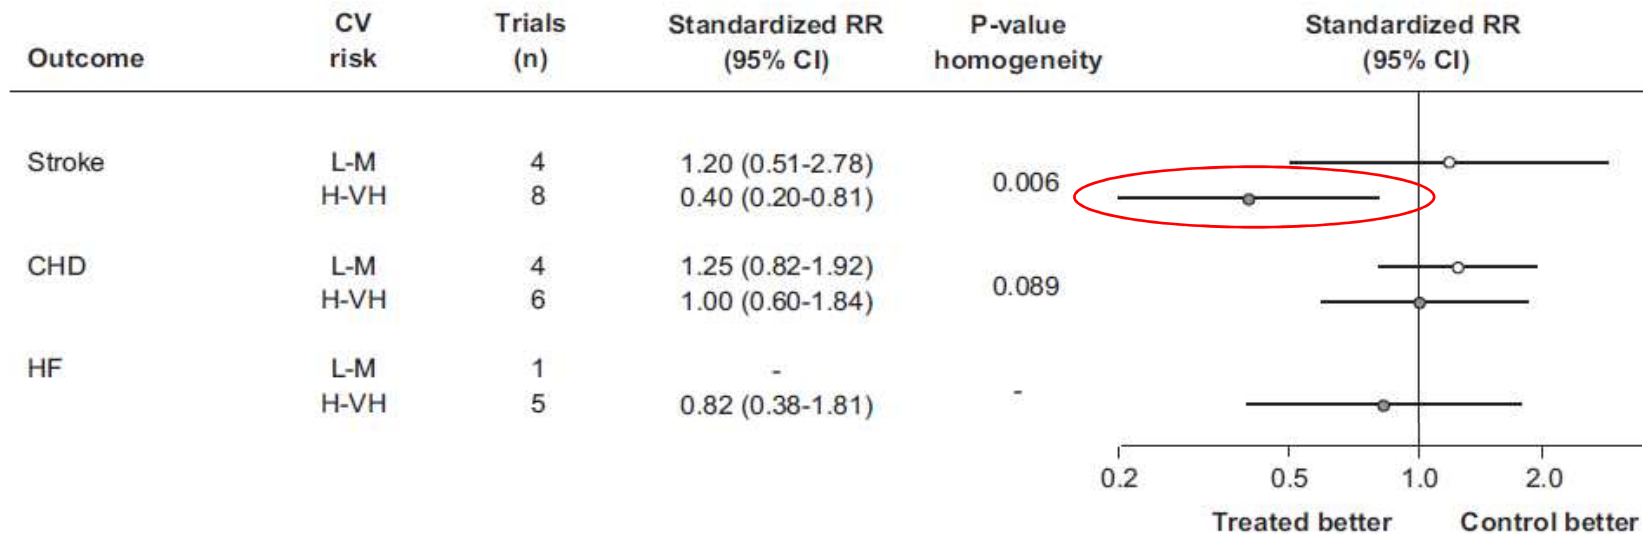

Effects of blood-pressure-lowering treatment on outcome incidence. 12. Effects in individuals with high-normal and normal blood pressure: overview and meta-analyses of randomized trials

Costas Thomopoulos<sup>a</sup>, Gianfranco Parati<sup>b,c</sup>, and Alberto Zanchetti<sup>d,e</sup>

High normal and normal BP  
(120-139/80-89 mmHg)

**Conclusion:** Individuals with very high cardiovascular risk due to symptomatic cardiovascular disease should consider BP-lowering treatment even when their BP is in the high-normal and normal range.

24 RCTs on 47 991 individuals

RR for  $\Delta$  SBP/DBP 10/5 mmHg

## 2017 AHA/ACC Guidelines: Target BP

There have been 8 recent meta-analyses addressing the issues of BP reduction and target BP levels for the treatment of hypertension (37-39, 43-47). Although treatment of hypertension was associated with improved outcomes in all 8 meta-analyses, the optimal target BP remains unclear. In the current systematic review and meta-analysis, we sought to determine the optimal targets for BP lowering during antihypertensive therapy in adults.

An electronic literature search was performed by Doctor Evidence, a global medical evidence software and services company, across PubMed and EMBASE from 1966 to April 13, 2015, using key words and relevant subject headings for “hypertension” combined with terms for the interventions of interest (see Online Data Supplement Part 2, Table 2.1). An additional PubMed search was performed through May 6, 2015. SPRINT (Systolic Blood Pressure Intervention Trial) was included in November 2015, and SPS3 (Secondary Prevention of Small Subcortical Strokes Trial) was included in April 2016 at the request of the ERC (48, 49). The ERC also searched bibliographies of recent, relevant meta analyses (37-39, 50).

All analyses were performed using an online platform (Doctor Evidence. 2016. DOC Data, Version 2.0. Santa Monica, CA: Doctor Evidence, LLC) that incorporated R statistical software using Metafor (55).

### About Doctor Evidence

The Doctor Evidence mission is *to improve clinical outcomes by finding and delivering medical evidence to healthcare professionals, medical associations, policy makers and manufacturers through revolutionary solutions that enable anyone to make informed decisions and policies using medical data that is more accessible, relevant and readable.*

We succeed in this mission by providing state-of-the-art tools and technologies that find, categorize, store and convert complex medical information from clinical studies into distributive databases to be delivered in a user-friendly format. Our team of clinicians, librarians, and IT specialists work in tandem with our clients to increase the value of their most important asset: clinical evidence.

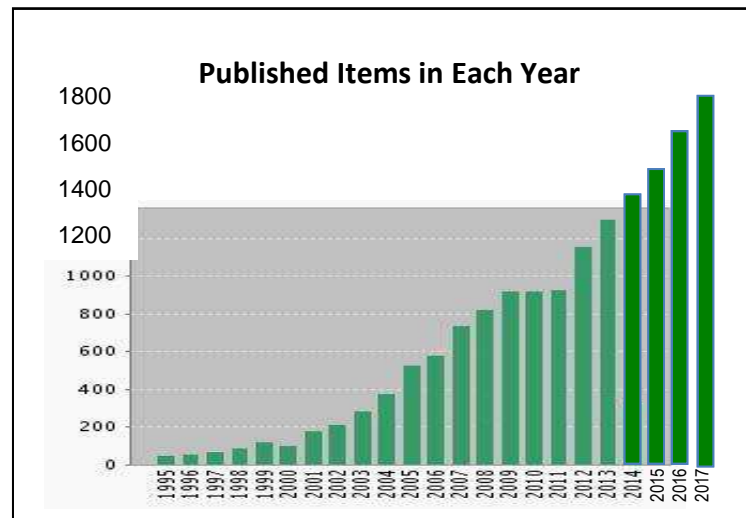

Doctor Evidence is devoted to delivering revolutionary solutions to address the current deficiency in the evidence-based clinical market. Unlike most "evidence-based" companies that summarize and reference evidence found in clinical studies, Doctor Evidence actually delivers answers derived directly from the clinical data. It is this Data-Driven approach that makes Doctor Evidence a unique company, offering the highest level of transparency in the market today. We invite you to investigate our technologies and services with the same zeal we use to investigate the clinical literature.
